

How To Do a...Scavenger Hunt!

Scavenger Hunts:

1. encourage student mobility
2. fully engage students
3. provide a means for the pairing/partnering of students
4. provide instant response for a correct (or incorrect) answer
5. are an atypical way to complete worksheet-type problems

Scavenger Hunts are an excellent way to review prior to a quiz or test. They're fun, innovative, and effective.

Materials: construction paper (1 piece for each poster), markers, scavenger hunt answer key/teacher page, tape (or some other means of hanging the posters – magnets, push pins, staples, etc.)

1. Orient the paper vertically and fold the top of the paper toward the bottom, leaving about 1½ - 2 inches of the bottom visible. This creates a flap for the poster.

2. Using the teacher page, each square has three components: a) poster letter on outside, b) poster answer on bottom, visible from afar and c) poster question/problem inside under flap. With a dark marker, transfer all three components of the first square to a poster using the following template:

3. Repeat the transfer for each square on the teacher page.
4. Hang the posters in a variety of places ensuring posters do not follow the correct order. Make sure to mix them up well. Ideas on where to hang posters include: walls, desktops, fronts of lockers, doors, windows, white boards, high places, low places, etc. Make it interesting and fun – be creative!

How To Do a...Scavenger Hunt!

5. Group students in pairs.
6. Assign each pair of students a different poster letter and release students to find that poster and stand in front of it.
7. Using their answer sheet, students are to record by #1 the poster letter with which they're starting.
8. Students are to ignore the answer portion of the first poster. They should lift the flap, then copy and solve the problem underneath showing all work.
9. Students then hunt for the poster that contains the answer they're looking for at the bottom of the poster (in the answer portion).
10. Once students have found the correct poster, they're to record their second poster letter by #2 and lift the flap, copy and solve the problem, and find the next poster in the sequence.
11. Students will repeat this process until they've done two things: a) come back to the poster at which they began, AND b) visited every poster available.

Helpful Hints and Tips:

- Old file folders work great as posters. You will just need to snip a little off one of the sides to have room for the answer portion of the poster design.
- Laminating blank pieces of construction paper would allow you to write on the laminate with a dry erase marker and reuse the posters.
- Take the scavenger hunt to the hallway or outside. Require students to communicate only through writing so as not to disturb other classes.
- Require students to show their work on their answer sheets so you can assist them with errors and mistakes. This could also serve as their grade for the day.
- If posters require graphs or charts according to the teacher pages, consider making a copy of the teacher page and taping or gluing the graphs and charts on the inside of the poster versus recreating them by hand and risk making a mistake.
- Before allowing the students to begin the scavenger hunt, double check the posters to make sure the problems and order are correct.
- For students not capable/willing to work with a partner, use your discretion to decide if you want the student to work alone to complete the scavenger hunt or provide the student with the problems to work independently so they're not missing out on the review.
- Establish clear expectations of acceptable and unacceptable behavior during a scavenger hunt and have consequences or alternative assignments ready.

How To Do...I Have, Who Has!

I Have, Who Has:

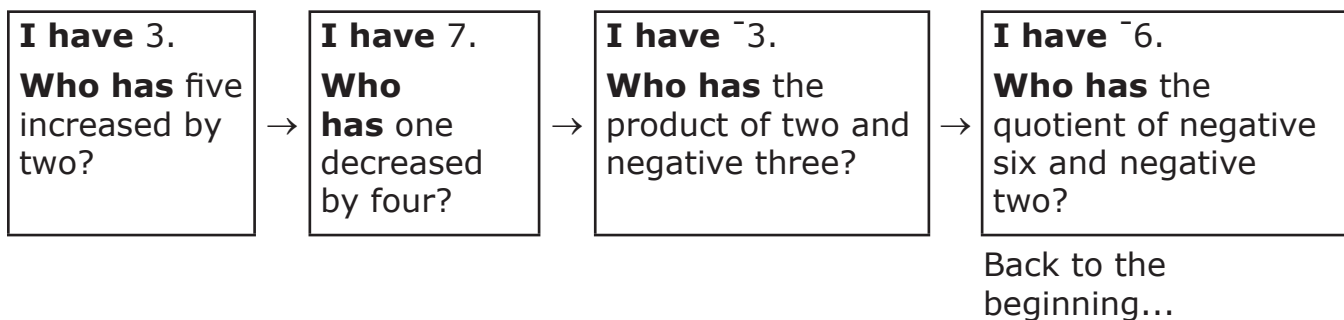

1. requires student participation with minimal effort/output
2. fully engages all students
3. calls on intense auditory processing
4. can be used multiple times
5. is a whole-class activity

I Have, Who Has is an excellent way to review materials and can also be used prior to a quiz or test.

Materials: teacher page, scissors, plastic bags or envelopes

1. Make one copy of the teacher page for a class set of cards.
2. Cut the cards apart.
3. Distribute cards among students so that all students have close to an equal number of cards. If there are more students than cards, have students work collaboratively.
4. Choose a student to begin. The student will read their entire card to the class with students paying particular attention to the "Who Has" portion of the card. Whoever has the correct response immediately begins reading their card.
5. The round is over when all cards have been read and the last "Who Has" brings you back to the student who began the activity.
6. Repeat activity at least once more.

Sample I Have, Who Has

How To Do...I Have, Who Has!**Helpful Hints and Tips:**

- Copying the activity onto card stock or laminating individual cards will help the deck last longer.
- Keep time the first round, then collect, shuffle and redistribute cards, and challenge the class to beat their first round time. This can be repeated several times in this fashion.
- An easy starting point would be with the person or teacher who has the upper left card on the teacher page. It makes it easier for following along with students.
- For students who have extreme difficulty with auditory processing, consider making a copy of the cards on a transparency and displaying the card that's being read for everyone to see OR write the "Who Has" portion on the board or overhead as it's read aloud.
- As students read/use their card(s), have them flip the card over so it's easy to keep track of what cards have been used and what cards have not.
- Clearly, listening and paying attention are two skills necessary for the success of this activity. Be prepared for the first round to be a little challenging.
- As a silent activity, students can line up by finding the matching card.

How To Do a...Mystery Square!

Mystery Squares provide students with practice for many concepts. The activity can be completed individually or in cooperative pairs.

Materials: activity, scissors or paper cutter, plastic bags or envelopes

1. Make enough copies of the activity for students (either individually or in cooperative pairs).
2. Cut the squares apart and place them in a plastic bag or envelope.
3. Distribute one set of squares to each student or pair of students.
4. Students may begin with any square they like and try to match a problem with its answer.
5. Students are finished when they successfully arrange the cards to form a perfect square where each problem is matched with its correct answer.

25 80 F $35 \div 7$ $100 \div 100$	1 120 \div 4 A 60 $30 \div 10$	$420 \div 7$ 21 S 68 $121 \div 11$
$39 \div 3$ 5 I $18 \div 9$ 41	2 3 U $568 \div 4$ $772 \div 2$	142 11 O $1000 \div 100$ $637 \div 7$
19 $164 \div 4$ T $837 \div 9$ 74	93 386 E $210 \div 7$ $10,000 \div 10$	30 91 N $328 \div 8$ 1000

How To Do a...Mystery Square!**Helpful Hints and Tips:**

- Squares are arranged in the correct order on the teacher page, so it is recommended that squares are cut out prior to being distributed to students.
- The top-left to bottom-right diagonal always spells a word. This allows you to quickly glance at a student's final product and know if he/she has completed it correctly.
- For students who are overwhelmed or confused by mystery squares, you can help by identifying the placement of one of the corner pieces. Consider making a copy of the teacher page onto a transparency and helping students get started as a group on the overhead.
- Unless you are re-using the squares, have students solve the problems on the squares to help them find a match.
- Cards have letters on them for two reasons: 1) for easy grading and 2) to give each square a designated orientation. Letters need to be right side up. This will ensure, should there be repeat answers among the cards, that there is only one possible way to match a problem with its answer.
- Copying cards onto card stock will help the cards last through multiple classes/years provided students do not write on them.

How To Do...Chain Reaction!

Chain Reaction:

1. requires student participation with minimal effort/output
2. fully engages students
3. provides a means for the pairing/partnering of students
4. provides instant response for a correct (or incorrect) answer
5. is an atypical way to complete worksheet-type problems

Chain Reaction is an activity to review topics recently covered in class. It is an excellent way to review prior to a quiz or test. Chain Reaction is a variation of the Scavenger Hunt.

Materials: teacher page, scissors, plastic bags or envelopes

1. Make enough copies of the teacher page for students (either individually or in cooperative pairs).
2. Cut the cards apart and place them in a plastic bag or envelope for the students.
3. Distribute one set of cards to each student or pair of students.
4. Students may begin with any card they like and match the problem at the bottom of a card with its answer at the top of another card.
5. Students are finished when they successfully arrange the cards so that all problems have correct answers in a chain.

Helpful Hints and Tips:

- It's recommended to cut out the cards prior to distributing them to students as the chain reaction cards are in order.
- You may have students solve the problems on the cards unless you want to reuse them.
- Students can tape or glue their cards onto construction paper to create a design, as long as each card is appropriately matched problem to answer.
- Students can begin with any card they wish. When grading their final product, simply scan the answer key for the card with which they began and move forward from that card.
- Copying the cards on card stock will help them last through multiple classes or years provided students do not write on them.

Add Integers - Think Maximum - Page 1 of 2**Materials:**

Two-color unit tiles to cover squares on the game board

Student copies of Think Maximum

How to Play:

- The first round can be played **teacher vs. students** to **introduce the rules of the game. (Hint: Use red tiles to mark the squares that have already been used and one yellow tile to mark the last move.)**
- Think Maximum is a two-player game.
- Players get points by covering squares on the game board. Point values are the values **within** the square the player selects.
- Player 1 may only move up and down. **(columns)**
- Player 2 may only move left and right. **(rows)**
- Place a yellow unit tile on the space M. This is the starting point, and this counter is your moving piece for the entire activity.
- Player 1 goes first by selecting any **number in the column of the yellow tile**, either up or down from the M.
- Move the yellow tile to the square selected and **place a red tile on the M to identify that M has been used.**
- Player 1 receives the point value in this square for this round.
- Player 2 follows by selecting any square **in the row of the yellow tile**, left or right from the square Player 1 previously picked.
- Player 2 receives the point value in the square selected for this round. Place a red tile on this square to **identify that this number has already been used** and can no longer be selected by either player.
- Player 1 follows by selecting any square **in the column of the yellow tile**, up or down from the square Player 2 selected.
- Play continues in this fashion, **using the yellow tile to identify the last move and red tiles to identify squares that have been chosen.**
- Players keep a running total of their points throughout the game.
- When there are no moves that a player can make (all spaces in their row or column are covered), the game is over, and the player with the most points wins.

KEY - Diagonal spells EASY.

Review Integers – Integer Card Game - Page 1 of 2

Materials: Deck of cards, score sheet

How to Play:

1. Give the score sheet to the person selected as the scorekeeper. This person should put each player's name on the score sheet.
2. The oldest person should deal first. Then, for each hand, the dealer will be the next person to the left of the previous dealer.
3. Red cards are negative. **(hearts and diamonds)**
Black cards are positive. **(spades and clubs)**
4. Numbered cards carry the value of the number on them.
Example: 4 of hearts = -4 10 of clubs = $+10$
5. Aces = 1 Jacks = 11 Queens = 12 Kings = 0
6. The dealer decides how many cards to deal. (no more than 6) The dealer also decides which operation to use (add, subtract, multiply) before dealing the cards. Division does not lend itself to this game.
Example: If the dealer calls 3 cards with addition, and someone gets the Jack of hearts, 2 of clubs, and 5 of diamonds, this person's hand is worth $-11 + +2 + -5$ or $-9 + -5 = -14$ points.
7. The object of the game is to have the highest number of points. (A player may subtract two cards in any order, which ever is better for that person.)
8. At the end of each hand, the scorekeeper should record the name of the person who had the highest points for that hand in the "WINNER" Column.
9. At the end of the game, the players of each group are to add all of the hands for each person to see who is the "BIG WINNER" for their group.

Helpful Hints and Tips:

- Play one round teacher versus students to review rules.
- Use only 3 cards the first time to play the game.
- Start with addition to understand the rules.

Introduction to Probability – Scavenger Hunt

$\frac{5}{15} = \frac{1}{3}$ <p>A</p> <p>Anna has to wear a uniform to school. She has 4 pairs of pants, 6 shirts, and 2 pairs of shoes. How many different outfits can she make?</p>	$\frac{3}{6} = \frac{1}{2}$ <p>G</p> <p>A pencil container has 3 red pencils, 5 yellow pencils, and 1 blue pencil. What is the probability of randomly selecting a yellow pencil?</p>	$\frac{2}{8} = \frac{1}{4}$ <p>E</p> <p>A spinner is divided into 8 equal sections which are numbered 1 – 8. What is the probability of spinning a number less than 4?</p>	$\frac{2}{7}$ <p>B</p> <p>At the ice cream store there is a choice of 8 flavors, 2 toppings, and 2 types of candy sprinkles. How many different ice cream sundae choices are possible?</p>
<p>48</p> <p>D</p> <p>There is a bag with 10 marbles. Six of the marbles are red, and four of the marbles are blue. What is the probability of selecting a blue marble at random?</p>	$\frac{5}{9}$ <p>H</p> <p>A bag contains the following letter tiles: (R, S, T, B, C, A). What is the probability of randomly choosing a consonant from the bag?</p>	$\frac{3}{8}$ <p>C</p> <p>A pencil container has 6 red pencils, 5 yellow pencils, and 3 blue pencils. What is the probability of randomly selecting a red pencil?</p>	<p>32</p> <p>L</p> <p>At the school cafeteria there are 5 main dish choices, 2 sides, and 2 types of dessert. How many lunch choices are possible?</p>
$\frac{4}{10} = \frac{2}{5}$ <p>F</p> <p>A bag contains number tiles from 1 - 10. What is the probability of choosing a number greater than 7?</p>	$\frac{5}{6}$ <p>K</p> <p>The United Middle School sweatshirt is available in 5 sizes. The sweatshirt comes in 2 different colors. How many different shirts are available?</p>	$\frac{6}{14} = \frac{3}{7}$ <p>I</p> <p>John is spinning a spinner with 6 equal sections numbered 1 – 6. What is the likelihood of spinning a 7?</p>	<p>20</p> <p>J</p> <p>There is a bag with 12 marbles. Two of the marbles are red, 6 of the marbles are green, and 4 of the marbles are blue. What is the probability of selecting a red marble at random?</p>
$\frac{3}{10}$ <p>P</p> <p>If you are tossing a fair number cube, what is the probability you will toss an even number?</p>	<p>10</p> <p>O</p> <p>Taylor is spinning a spinner with 8 equal sections numbered 1 – 8. What is the probability she will spin a number greater than 6?</p>	<p>impossible</p> <p>N</p> <p>A bag contains the following letter tiles: (W, T, R, U, M, G, and E). What is the probability of randomly choosing a vowel from the bag?</p>	$\frac{2}{12} = \frac{1}{6}$ <p>M</p> <p>A bag contains number tiles from 1 – 15. What is the probability of choosing a number less than 6?</p>

Key: A, D, F, P, G, H, K, O, E, C, I, N, B, L, J, M, back to A

Relative Frequency – Chain Reaction - Page 1 of 2

$\frac{20}{40} = 50\%$ <p style="text-align: center;">R</p> <p>A spinner has four equal sections: blue, green, red, and yellow. When Jennifer spins the spinner 50 times, she has a spin of yellow 11 times. What is the relative frequency of spinning a yellow?</p>	$\frac{15}{50} = 30\%$ <p style="text-align: center;">L</p> <p>Torie has a spinner with six equal sections numbered 1 – 6. She spun a total of 40 times. She landed on the number 3 eight times. What is the relative frequency of landing on a 3?</p>
$\frac{11}{50} = 22\%$ <p style="text-align: center;">M</p> <p>Jan flipped a coin 25 times and got heads 10 times. What is the relative frequency of tossing a head on the coin?</p>	$\frac{8}{40} = 20\%$ <p style="text-align: center;">P</p> <p>A fair number cube is rolled 50 times. The cube lands on a number greater than 4 thirty-five times. What is the relative frequency of rolling a number greater than 4?</p>
$\frac{10}{25} = 40\%$ <p style="text-align: center;">H</p> <p>A bag of marbles has 10 yellows, 6 greens, and 4 reds. Dale randomly chooses a marble 20 times, replacing the marble each time. Of his 20 picks, 7 are green. What is the relative frequency of choosing a green?</p>	$\frac{35}{50} = 70\%$ <p style="text-align: center;">N</p> <p>Barry rolled a number cube 21 times. He landed on a number greater than two 15 times. What is the relative frequency of rolling a number greater than two? (Round to the nearest hundredth)</p>
$\frac{7}{20} = 35\%$ <p style="text-align: center;">C</p> <p>Karen has randomly selected a marble out of a bag 25 times. In the bag there are 13 red and 12 black marbles. She has chosen a black marble 16 times. What is the relative frequency of choosing a black marble?</p>	$\frac{15}{21} = 71.43\%$ <p style="text-align: center;">A</p> <p>Clarence has flipped a coin 12 times. The coin landed on heads only twice. What is the experimental probability of landing on heads? (Round to the nearest hundredth)</p>

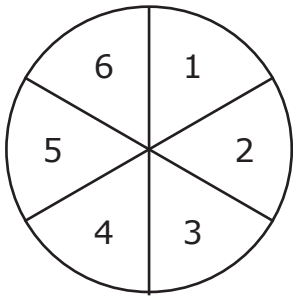

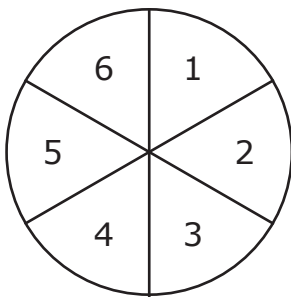

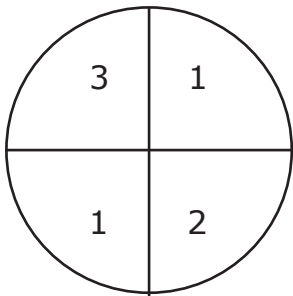

Key: R, M, H, C, E, D, Q, J, L, P, N, A, K, B, S, F, back to R

Relative Frequency – Chain Reaction - Page 2 of 2

$\frac{16}{25} = 64\%$ <p style="text-align: center;">E</p> <p>In a bag of jelly beans, 10 are purple, 12 are green, 8 are yellow, 5 are orange, and 5 are red. If Sonya were to pick a jelly bean out of the bag 40 times, what do you expect the probability of picking a purple jelly bean to be?</p>	$\frac{2}{12} = 16.67\%$ <p style="text-align: center;">K</p> <p>Walter has rolled a number cube 50 times. He rolled the number 4 twenty-two times. What is the experimental probability of rolling a 4?</p>
$\frac{10}{40} = 25\%$ <p style="text-align: center;">D</p> <p>Erin spun a spinner that is divided into four equal parts: red, green, yellow, and blue. She spun 24 times and landed on blue 10 times. What is the relative frequency of landing on blue? (Round to the nearest hundredth)</p>	$\frac{22}{50} = 44\%$ <p style="text-align: center;">B</p> <p>A spinner has five equal sections numbered 1 – 5. A student spins the spinner 20 times and lands on an even number 12 times. What is the relative frequency of landing on an even number?</p>
$\frac{10}{24} = 41.67\%$ <p style="text-align: center;">Q</p> <p>Maurice rolled a fair number cube 30 times. He rolled a number less than three on 22 of those rolls. What is the relative frequency of rolling a number less than three? (Round to the nearest hundredth)</p>	$\frac{12}{20} = 60\%$ <p style="text-align: center;">S</p> <p>A bag contains colored cubes. There are 4 red cubes, 6 green cubes, 2 black cubes, 7 blue cubes, and 1 white cube. Barb chooses a cube 40 times and replaces the cube each time. Out of the 40 times she pulls a cube, 6 of them are green. What is the relative frequency of green?</p>
$\frac{22}{30} = 73.33\%$ <p style="text-align: center;">J</p> <p>Out of a bag of 25 red and 25 yellow colored chips, Chris picked a chip 50 times. Of those fifty picks, he drew a yellow chip 15 times. What is the relative frequency of picking a yellow chip?</p>	$\frac{6}{40} = 15\%$ <p style="text-align: center;">F</p> <p>Out of a bag of 20 red and 20 yellow colored chips, Noah picked a chip and then replaced it 40 times. How many times would you expect him to draw a red chip?</p>

Uniform and Non-Uniform Probability Models – Chain Reaction - Page 4 of 4

B. Choosing a marble at random from a bag with 5 red marbles and 5 blue marbles

If you spin the spinner 24 times, what would you predict would be the possible experimental probability for spinning a 2?

$$\frac{15}{20} = \frac{3}{4}$$

What is the probability of spinning a number greater than 1?

$$\frac{8}{24} = \frac{1}{3}$$

What number do you expect the spinner to land on most frequently?

$$\frac{5}{6}$$

S

Which of the following examples is a non-uniform probability model?

- A. A spinner with four equal sections numbered 1, 1, 2, 3
- B. A spinner with four equal sections numbered 1, 2, 3, 4

Key: C, K, R, E, B, F, L, Q, M, T, H, D, A, G, P, S, back to C

Compound Probability - Chain Reaction

$\frac{9}{25}$ G A fair number cube is rolled. What is the probability of rolling a 6 and then rolling a 5?	$\frac{4}{27}$ M James has 6 plain t-shirts and 8 t-shirts with pictures on them. What is the probability that he will randomly select a plain shirt and then a shirt with a picture, without replacing the first shirt?	$\frac{1}{8}$ A There are 16 boys and 14 girls in math class. What is the probability of randomly selecting 2 boys' names from the class list without replacement?	$\frac{5}{36}$ C A fair number cube is rolled. What is the probability of rolling an even number and then rolling an odd number?
$\frac{1}{36}$ B A spinner is divided into 10 equal sections numbered 1 - 10. What is the probability of spinning a number greater than 7 and then spinning a 5?	$\frac{24}{91}$ D A fair number cube is rolled two times. What is the probability of rolling a number less than 3 and then rolling a 6?	$\frac{8}{29}$ F A spinner is divided into five equal sections that are red, blue, green, yellow, and orange. What is the probability of spinning a blue and then spinning a green?	$\frac{1}{4}$ P A spinner is divided into 10 equal sections numbered 1 - 10. What is the probability of spinning a number greater than 3 and then spinning a number greater than 6?
$\frac{3}{100}$ E A spinner is divided into 8 equal sections numbered 1 - 8. What is the probability of spinning a number less than 7 and then spinning an even number?	$\frac{1}{18}$ H A bag contains 4 red marbles, 3 blue marbles, and 2 green marbles. What is the probability of choosing a green marble from the bag and then a red marble, without replacing the first marble?	$\frac{1}{25}$ O A fair number cube is rolled. What is the probability of rolling a number less than 5 and then rolling a number greater than 4?	$\frac{7}{25}$ L A bag contains 5 red marbles, 6 blue marbles, and 4 green marbles. What is the probability of choosing a red marble and then choosing green marble from the bag without replacing the first marble?
$\frac{3}{8}$ T A bag contains 4 red marbles, 3 blue marbles, and 2 green marbles. What is the probability of choosing a blue marble from the bag, replacing it, and then drawing a red?	$\frac{1}{9}$ K In a math card game, there are 20 cards numbered 1-20. What is the probability of randomly choosing a card greater than 15, replacing the card, and choosing an odd number?	$\frac{2}{9}$ S In a word game there are 60 alphabet tiles. 50 out of the 60 tiles are consonants. What is the probability of drawing a consonant, replacing it, and drawing a vowel?	$\frac{2}{21}$ N A bag contains 25 colored tiles. Fifteen of the tiles are red, and ten are blue. What is the probability of drawing a red, replacing it, and then drawing another red?
